

Task 12: Elementary data structure algorithms-based questions and finding complexity.

### Little Shins and Pairs:

Get to print out all the pairs in selectively.

Given a permutation of numbers from

1 to N. Among all the subarrays, find the number of unique pairs such that i and j is maximum and i & j is second maximum in the array.  $\{1, 6, 5, 7, 3\}$

### Input:

first line contains an integer, N second line

contains N space separated distinct integers denoting the permutation.

### Output:

print the required answer

### SAMPLE INPUT:

5

1 2 3 4 5

### SAMPLE OUTPUT: 4

Output:

algorithm: ~~algorithm~~ without a while statement : START

1. Read the input values of  $N$  and the permutation array

A.

2. Initialize a variable count to 0, keep track of the number of valid pairs.

3. Loop over all possible subarrays of A, with nested loops!

i and j: ~~maximum i < j < n~~ ~~both loops missed~~ ~~missed~~

a) Find the maximum element max in subarray [i:j].

max[i:j] in the subarray [i:j].

b) Print the final value of count.

program: ~~program~~ ~~function~~ ~~for loop~~ ~~if condition~~ ~~else if~~

```
#include <stdio.h>
```

```
int main() {
```

```
    int n, i, j, max, second_max, count = 0;
```

```
    scanf("%d", &n);
```

```
    int arr[n];
```

```
    for (i = 0; i < n; i++) {
```

```
        max = arr[i];
```

```
        second_max = -1;
```

```
        if (arr[i] > max) {
```

```
            second_max = max;
```

```
            max = arr[i];
```

```
}
```

SAMPLE OUTPUT:

4

Algorithm:

1. Calculate the sum of first  $n$  natural numbers.

2. Create an array of size equal to the sum calculated in step 1.

3. Loop through the range from 1 to  $n+1$ .

4. Return the variable result as the output.

### Program:

```
#include <stdio.h>
#include <stdlib.h>
int main() {
    int T, n, i, j, k, sum, size;
    scanf("%d", &T);
    while (T--) {
        scanf("%d", &n);
        size = (n * (n + 1)) / 2;
        int *arr = (int *) malloc(sizeof(int) * size);
        for (i = 0; i < size; i++) {
            if (i % 2 == 0) {
                for (j = 0; j < i; j++) {
                    arr[i] = j;
                }
            }
            for (int l = j + 1; l < i; l++) {
                if (arr[l] > arr[man + l]) {
                    man = l;
                }
            }
            int temp = arr[i];
            arr[i] = arr[man + l];
            arr[man + l] = temp;
        }
        man = 1;
    }
}
```

```
int temp = arr[j+k];
arr[j+k] = arr[min+k]; arr[min+k] = temp;
}
sum += arr[k]; k++;
}
else {
    for(j=0; j<i; j++){
        int min = j;
        for(int l=j+1; l<i; l++) {
            if(arr[l+k] < arr[min+k]) {
                min = l;
            }
        }
        sum += arr[l];
        l = i;
    }
    printf("%d\n", sum); free(arr);
}
return 0;
}
```
