

TASK:8 Array introduction, memory allocation (with row/column major) operation sorted and unsorted array, suffix array.

Raman loves mathematics a lot. One day his math teacher gave him an interesting problem. He was given an array 'A' consisting of 'n' integers, he was needed to find the maximum value. Inputs were given as integers.

- First line of input contains an integer T denoting number of test cases. T is not known to user at first.
- Each test case contains two values, first line contains an integer n where n is the no. of elements in array.
- Second line contains n space separated integers.

Output:

Print the maximum value of the above equation

for each test case separated in a new line.

Sample Input:

2

3

1 2 5

4

1 2 3 4

Sample output: ~~program~~ reads input from user & ~~prints~~ output

5 4
5 4 between two below numbers (leftmost number)

4 5 other

Algorithm:

1. Read the no. of elements n in the array A
2. Reading the array A
3. Initialize max_val to -1 (initial to find max 'A' greater)
4. Repeat the following steps for all possible partition cases:
 $i <= i < j < n$ (partition no. starting from 1 to end) for.
5. print the value of max_val for the current partition case.
6. enddo (repeat until all partitions are done)

Program: i controls to do it in which partition

#include <stdio.h> // header file includes stdio and brese.

void rotate(int arr[], int n, int k)

{
k = k % n;

int temp[k];

for (int i=0; i<k; i++)

{ temp[i] = arr[n-k+i];

}

for (int i=n-1; i>=k; i--){

arr[i] = arr[i-k];

}

for (int i=0; i<k; i++)

{ arr[i] = temp[i];

```

3
3
int main()
{
    int n,k;
    printf("Enter the size of the array: ");
    scanf("%d",&n);
    int arr[n];
    printf("Enter the array elements: ");
    for(int i=0; i<n; i++){
        printf(" %d ", arr[i]);
    }
    return 0;
}

```

Output: To find the last element of the array.

enter the size of the array: 10

enter the array elements: 1 2 3 4 5 6 7 8 9 0

enter the no. of position to rotate: 5

the rotated array is: 6 7 8 9 0 1 2 3 4 5

Problem:

Students have become secret admirers of grade. They find the course exciting and the course coming after a superb mid semester examination its now time for results. Since you are a curious kid, you want to find all the marks that are not smaller than those on array.

(1) 100 to 90 - 90 to 80 - 80 to 70 - 70 to 60 - 60 to 50 - 50 to 40 - 40 to 30 - 30 to 20 - 20 to 10 - 10 to 5 - 5 to 0

constraint:

$1 \leq n \leq 1000000$

(\rightarrow more for)

$0 \leq arr[i] \leq 10000$

(\rightarrow arr[i])

Sample input: (\rightarrow given all the arr[i] values) strings

4

(\rightarrow 4th arr[i])

5 7 3 6

(\rightarrow 3rd arr[i])

Sample output: (\rightarrow materials given all the arr[i] values)

7

(\rightarrow 1st arr[i])

Algorithm:

1. Read the input values of n and the array arr .
2. Initialize a variable max as the first element of the array $arr[0]$.
 \rightarrow arr[0] to arr[n-1] strings
3. Traverse over the array arr from right to left and for each element $arr[i]$:
 \rightarrow start of reading to end of string \rightarrow arr[i] to arr[0]
4. end.

Program:

```
#include <stdio.h>
int maxSubArray(int arr[], int n)
{
    int max_so_far = arr[0];
    int max_ending_here = arr[0];
    for (int i = 1; i < n; i++) {
        max_ending_here = arr[i] > max_ending_here + arr[i] ? arr[i] : max_ending_here + arr[i];
        max_so_far = (max_so_far > max_ending_here) ? max_so_far : max_ending_here;
    }
}
```

```

main - ending - here;
{
    return max - sum - far;
}
int main()
{
    int max - sum = maxSubArray (arr, n);
    printf ("The maximum subarray sum is: %d\n", max - sum);
    return 0;
}

Output:
Enter the size of array: 5
enter the elements of array: 1 2 3 4 5
The maximum subarray sum is: 15

```
